## Fasteners

---

### Nails

Can be used on any assembly method but is probably the weakest fastener. It is susceptible to freeze/thaw more so than other fasteners

### Wood Screw

A wood screw is sturdy and long lasting. Most are galvanized or coated to prevent rust and can be removed when needed. This can be used on any method of wall assembly.

### Nuts and Bolts

Nuts and bolts work best on bracketed and corner-posted beds. However, despite coating to prevent rust, removing them will be difficult. A wood screw is preferred if possible.
